

Thinking SAFE RecoveryShield Online Backup and Disaster Recovery Software

Thinking SAFE's RecoveryShield™ data management software provides powerful, centralised and de-duplicated disk-to-disk backup and archive to achieve cost-effective data protection and disaster recovery management.

RecoveryShield™ is the preferred data protection solution for hundreds of UK organisations, from single location companies, through to large companies with multiple locations. Customers include National Express and Addison Lee (leading transport providers), Virgin Management, Jelf Group plc (FSA-regulated corporate consultancy), [Cripps Harries Hall](#) and [Lanyon Bowdler](#) (law firms); and [Menzies](#), and Tenon (leading UK accountancy firms).

RecoveryShield™ automates protection of data across any enterprise, including servers - both local and remote, PCs, and individual laptops carrying high-value current data - addressing all the issues associated with backup to tape - such as inconvenience, inefficiency and unreliability.

Data is de-duplicated, compressed and encrypted as it is backed up to a local NAS, PC, or low-cost RAID1 disk appliance, so that data is available for immediate restore. It is then automatically replicated off-site, providing secure remote copies and ensuring that data is completely safe in the event of disaster. Powerful replication and forward recovery functionality, leveraging virtualisation technology, enables rapid disaster recovery with minimal data loss.

The key benefits delivered by Thinking SAFE solutions include:

- Automation and centralised management of backup, recovery and archive
- All data secured in a single software platform, across single or multiple sites
- Improved reliability and resilience of data backup
- Reduced IT administration and operational time
- Reduced costs for backup and recovery
- Disaster recovery capability to virtual and physical environments
- High availability combined with backup
- Storage and bandwidth utilisation minimised by de-duplication and compression
- Data fully encrypted with 256 bit AES

Thinking SAFE offers a range of options to meet client preference, from ownership of the solution, to provision as a fully managed data backup solution.

If you would like to find out more about how a Thinking SAFE solution could benefit your own organisation, please contact Pierre Fourie at enquiries@fincit.com to arrange an informal discussion of your requirements.
